

Hepatitis C Also called: HCV

Hepatitis C is one type of hepatitis – a liver disease – caused by the hepatitis C virus (HCV).

Medicines sometimes help, but side effects can be a problem.

Serious cases may need a liver transplant.

It usually spreads through contact with infected blood.

There is no vaccine for HCV.

It can also spread through sex with an infected person and from mother to baby during childbirth.

Most people who are infected with hepatitis C don't have any symptoms for years.

A blood test can tell if you have it.

Unlike some other forms of hepatitis, hepatitis C does not get better by itself.

The infection can last a lifetime and may lead to liver cancer.
